## Operations.

Aug. 13 Amputations of first and second fingers at second joints. The fingers had been chopped off with a knife accidentally.  
 Patient *Sam Craig, An McLean, Cal.*

Sept 13 Removal of sliver of wood, half size of small lead pencil, which had been driven one inch into tissues beneath eye, entering into soft tissues of orbital cavity, but not injuring eye ball.  
 Patient *Edward Ragan, Surgeon Craig.*

Oct 1913 Incision, curettage, and drainage of large tubercular abscess of hip. No ~~hard~~ bone was found, but it was impossible to explore wound thoroughly as local anaesthetic was used. Iodoform glycerin emulsion was then injected.  
 Patient *Andrew Jackson (1) Surg. Capt. Lambie, Astoria, Ore.*

Enucleation of tonsils and removal of adenoids.  
 Patient *Daisy Jackson (6) An. Welden, Surg. Craig, Chas. + Arthur*

Nov. Removal of pterygium of right eye, transplantation method.  
 Patient *Sam Craig (1) Surg. Lambie, Astoria, Ore.*

Dec 19/13  
4  
1 conf  
1 min

Normal labor, S. O. A. with tear of second degree. Immediate repair.  
*Bessie Williams (#11) Ap. Craig, As. White*

72.  
1 min

Enucleation of tonsils. During dissection of right tonsil which protruded nearly to median line, there was a gush of pus. Throat healed up rapidly.

*Joseph Green (#31) Ap. Craig, As. White, As. White*

## January 1914

Jan  
3.

Normal labor S. O. A. Multipara. No tear.

1 conf.

*Mr. John Jones (#2) Ap. Craig.*

9.  
1 min

Suturing of lacerated gunshot wound of fore-head. Silk worm gut drainage. Healing by first intention.

*Harold Hunt (#26) Ap. Craig, As. Lamb, As. Lamb*

16.  
1 min

Enucleation of enlarged diseased tonsils with broken down, discharging, cervical glands of neck.

*Austin Hammond (#2) Surg. Craig, As. Lamb, As. White*

17.  
1 min

Excision of elliptical piece of skin, fascia and muscle from lower eye lid for cure of entropion. Wound sutured with silk. Primary union.

*Joe Whimbush (#25) Ap. Craig, As. Lamb*

2.  
1 min

Enucleation of enlarged tonsils.

*Les Krenner (#22) Ap. Lamb, As. Lamb, As. White*

Jan.  
Cont.  
22  
1. maj.

External and internal urethrotomy for stricture of urethra. Catheter left in urethra for drainage but came out during first night. Gauze (iodiform) left for drainage in perineal wound, removed on second day. Urine passed through perineal wound for number of days. Prostatic curved sound inserted on third day, could not be passed into bladder because of tension and spasm of sphincter muscles. Sounds passed every day afterwards and entered bladder without difficulty.  
*Haring Lee (#27) Ap. Sambie, Au Crang, Ahlan.*

27  
1. min

Curettage of uterus for long continued discharge. Examination of sputum showed presence of t. f. c. bacilli altho her general condition gave no evidence of such infection. Examination of cervical discharge showed no evidence of intra-cellular gonococci. It was thought probable that there was ~~an~~ t. f. c. infection of tubes, but on account of her general infection it was decided that a laparotomy was contra-indicated. W.

Uterus was swabbed out with pure tr. iodine and iodiform gauze packing inserted for one day.  
*W. H. Lee (#28) Ap. Sambie, Au Crang, Ahlan.*

Total Operations	6
Conf	1

# February

35

Feb 13  
1 min

Enucleation of enlarged tonsils complicated with chronic otitis media. Uneventful recovery.  
*James T. Smith (#11) of Gray, Conn.*

Jan 27  
1 min

Enucleation of enlarged tonsils.  
*Ida Belmont (#11) of Gray, Conn.*

# March

Mar 6.  
1 maj.

Operation for removal of senile cataract from left eye. Cataract was over ripe and very soft. As soon as incision was made the lens was expelled and considerable vitreous escaped.  
*Joe Whisker (#41) of Conn., Dr. Gray, Conn.*

6.  
1 min.

Administration of neo-salvarsan for tertiary syphilis. Patient had gumma of tongue, and eruption of arm.  
*Miss Leah Johnson (#73) of Conn., Dr. Gray.*

12.

Normal labor P. O. A. Duration of pain about 5 hours. No tear.  
*Miss Jennie Jones (#4) of Gray, Conn.*

Mar 14

Normal labor, right occiput anterior position. Very rapid expulsion of child immediately after rupture of membranes, which were ruptured artificially.

Child, which was female, was dead; the skin was macerated and soft. In places the body was dark and discolored, especially on abdomen. The child had evidently been dead for some time.

She gave a history of having had abdominal pains and of feeling very sick about one month before birth, since which time no movements of child had been felt.

There was a laceration of the perineum of second degree, which was repaired immediately.

Mary Smith (111) of Carey, the patient. Patient afterward developed mild saprophytic infection with very low temperature. Discharge very profuse, bloody, and characteristic odor of this infection. There was no gain with that infection. Improvement was rapid.

Mar 18/14

Normal labor, vertex presentation, slight tear of mucus membrane repaired immediately. Artificial rupture of membranes.

Mrs. J. J. (111) of Carey, the patient.

Recovery rapid.

Operations

Major Minor Obstet.

0

0

3.

Conc.

1

1

April 1914

Enucleation of tonsils and adenoids.

Philip Falconer (57) Dr. Craig, Dr. Lambie, Dr. Webster

Enucleation of enlarged tonsils.  
One tonsil filled with pus.

Harry Wilson (12) Dr. Lambie, Dr. Craig, Dr. Webster

May 1914

May 3 Prolonged labor, occiput anterior position, uterine inertia.  
Duration of labor 37 hours.  
Liquor amnii escaped at about eight hours so that this was a "dry labor".

After expulsion of placenta there was a very severe uterine hemorrhage (post-partum). Patient was almost unconscious from loss of blood before infusion could be administered.

Baby normal.

Mrs. Harry Philips (64) Dr. Craig, Dr. Lambie

May 11 Normal labour, occiput presentation.  
Cord around neck.

Mrs. E. K. Duncan (42) Dr. Craig, Dr. Lambie

Recovery uneventful.

May 16 Removal of broken mammary glands  
of axilla.  
These glands were about one week  
in formation. Day before operation  
there was a leucocytosis of 15,800  
and temp 101°.  
Tub drainage for four days.  
Patient out of bed and feeling fine  
on fifth day, temp normal.  
*(continued from p. 37) (p. 37) (p. 37) (p. 37) (p. 37)*

May 29. Precipitate delivery of normal  
foetus, labor pains lasting about  
one hour. Recovery unusually  
prompt altho patient has had hemorrhage  
from lungs. No tear.  
*(continued from p. 37) (p. 37) (p. 37) (p. 37) (p. 37)*

May. Operations  
Confinements 3 Craig.  
Oper. minor 1  
4

June 1914.

June 5, 1914

Repair of deep traumatic incision of foot. Tendonous to three smaller toes, which had been severed were repaired.

Edward Jackson (74) of 6000 1/2 St. N. W. D. C.

Healing by secondary union.

June 9.

Application of low forceps, cephalic.  
Repair of lacerated perineum, 2nd degree.

Wm. H. H. (74) of 6000 1/2 St. N. W. D. C.

Head (L.O.A) presentation - normal labor.

Craig 1 m. of 1/2.

1914

July 5.

July 1914.

Application of high forceps for  
prolonged labor and inertia  
head presentation. Repair of lacerated  
perineum, 2nd degree.

*Mr. Lambie (90) of Lambie & Williams*

2 conf.

\* minor op.

July 23.

Normal labor, head presentation

September 1914.

Sept 2 Circumcision for phimosis. Cocaine anal.  
1 min. One stitch only necessary.  
*Walter Falconer, Op. Craig, Asst. Reagh.*

Sept 3. Excision of mole from right supra-scap-  
ular claviclar region. Cocaine.  
*Walter Falconer, Op. Craig.*

" 24 Normal labor, R.O.D. No escape of  
liquor amnii until after birth of  
1 conf. head. Membranes <sup>did</sup> not rupture spontaneously  
1 min. but were ruptured manually as head  
passed down over perineum.  
Tear of anterior vaginal wall,  
one inch long + 1/4 inch deep, repaired  
with one stitch of cat-gut. Girl baby.  
*Walter Falconer (120) Op. Craig, Asst. Reagh.*

" 25 Normal labor, vertex position; no  
1 conf. escape of liquor amnii until after  
birth of shoulders; artificial rupture of  
membranes when head appeared at vaginal  
orifice. Patient had very little shock  
from expulsion of child; no tear. Placenta  
retained for 45 minutes when the uterus  
was massaged slightly; placenta then  
delivered with little hemorrhage; one hour  
later there was sudden gush of blood  
from uterus— which was massaged  
immediately by nurse, but before hemorrhage  
was checked patient was considerably  
shocked by loss of blood from which she  
recovered quite rapidly, so that no  
infusions of saline were resorted to.  
Expulsion of clot, size of man's fist, on  
fifth day.  
*Walter Falconer (122) Op. Craig, Asst. Reagh & Asst. Shaver.*

30 Re-circumcision for phimosis. Foreskin had  
1 min. contracted to pin-point size after first  
operation. No stitches  
*Walter Falconer, Op. Craig, Asst. Reagh & Asst. Shaver.*

1 min. Evacuation of tonsils and removal of adenoids

" " finished	2.35	" "
Ended anaesthetic	2.10	" "
Pulse before anaes.	60	
" after operation	64	
Time of operation	2.55	

Patient recovered from anaesthetic very  
quickly, recognized nurses in one  
half hour after being removed to room.  
No post operative vomiting and she  
said there was very little pain.  
Patient went to operating room in a  
very tranquil state of mind, and  
very little anaesthetic (ether) was  
required. About 9th day there was  
a slightly bloody exudate when abdominal  
stitch was removed. This was due to  
an infection of fat which caused wound to  
separate for distance of one inch. The  
superficial fat only was involved,  
which delayed healing somewhat.

11  
1 min Enucleation of enlarged tonsils and  
adenoids.  
*John H. Hild (134) Dr. Lambie, Dr. Craig, Dr. Jackson*

Exam of patient's throat before leaving shows  
some tonsillar tissue remaining on left  
side.

Recovery from operation uneventful.

12  
1 min Appendiceal abscess accompanying pregnancy  
of four months.

On twelfth day of disease incision  
made over McBurney's point down  
into abdomen. Pregnant uterus was  
faintly visible by side of cecum, and  
had pushed intestines upward. No adhesions  
between cecum and intestines, or other  
abdominal viscera, but cecum was very  
firmly adherent to posterior wall and  
the appendix was embedded in this mass.  
During manipulations of cecum there  
was a sudden gush of yellow pus from  
region of cecum, estimated to be about 3 viii,  
with very intensively foul odor of colon  
bacillus infection. No search was  
made for appendix. Wound washed  
out with saline solution. Two  
drainage tubes inserted. Wound  
closed except for drainage in center.

*Chlor + other.*  
*W. S. J. C. Bowman (165) Dr. Lambie, Dr. Craig, Dr. Jackson*

20. Laparotomy.  
 Median line incision, below  
 umbilicus. Exam showed right tube  
 and ovary normal; left ovary large  
 and cystic; tube hyperemic. The  
 tube was divided about halfway  
 from uterus and ligated; distal  
 part of tube and ovary removed.  
 No adhesions.

1913 Normal labor, male child.  
 Met 3rd Cord Around neck. Tear first degree only.  
 1 conf. Mrs. John Loner. (176) W. Craig, As Surg.

4th Normal labor. 10.4. 1st Laceration  
 1 conf. of second degree, repaired immediately  
 1 min. with one silk worm gut suture.  
 Mrs. Chas. Bartlett. (178) W. Craig.

10th Excision of enlarged diseased tonsil.  
 1 min. Much difficulty in getting patient relaxed  
 under anæsthetic. It was necessary to  
 work in throat for minute, and then  
 apply mask to face again. On this  
 account impossible to do sufficient work.  
 After patient was removed to bed bleeding  
 persisted, and he was finally taken back  
 to operating room, where attempts were  
 made to discover the source of the  
 hemorrhage, but it was impossible to locate it.  
 Adrenalin solution, hydrogen peroxide,  
 pressure, and cold application seemed  
 to have lasting effects. Slow bleeding  
 continued until 6 P. M. when it gradually  
 ceased.

Examination of throat shows that part of  
 left tonsil remains, but right side seems  
 very clean.

Dictated (180) W. Craig, As Surg. <sup>Chas. Loner</sup> <sup>Chas. Loner</sup>  
 Patient left hospital on morning of third day  
 following operation

18 Enucleation of enlarged tonsils.  
 1 min. Tonsilotome used after snare failed to  
 work.  
 Examination of throat when patient left  
 hospital showed that part of base of each  
 tonsil still remained.

Feb.

13 Normal labor, 16 hr.  
1 conf. Mrs. Wm. Kingston of Long.

Patient made very rapid and uneventful recovery, leaving hospital on 14th day.

22 Confinement. - During second stage tones  
1 conf. of head were felt to be very loosely  
macerated foetus. held together: very movable. Card was  
discovered to be around neck before birth  
of head, but efforts to remove it were  
unsuccessful; after birth of head the  
cord was ligated and cut; then foetus was  
allowed to be expelled. Card was black in  
color, and foetus was macerated.

Altho the mother was primiparae,  
age about 28, with rigid vaginal  
walls and perineum, there were  
no tears, due, probably, to the fact  
that child's head was very soft  
and easily moulded.

Same patient (113) of Long.

On third day temperature was 103°, with  
unusually small amount of lochia.  
Taken to operating room and given  
uterine irrigation. Temperature  
that night was 104°, and she  
was again taken to operating  
room, administered an anaesthetic,  
and an attempt was made to  
make a digital examination of  
interior of uterus, with object in view of  
removing any clots or membranes  
that were retained. But due to the  
narrow rigid vagina, which had not been  
dilated thoroughly by the small, well moulded  
head of foetus, the hand could not be  
passed into vagina, but only one  
finger inserted into uterine cavity.  
This method was then abandoned, and another  
hot intrauterine douche given. In two  
days temp began to decline, and in  
one week was normal. Recovery followed.

Feb.

1 conf.

Immature labor; labor about  
 six month. The child was  
 a first child, which was  
 very small, made few attempts at  
 respiration; but after one or two  
 feeble efforts, ceased to beat, about  
 thirty seconds child would  
 give a short gasping breath, during  
 artificial respiration. Artificial  
 respiration continued for 45 minutes.  
 Heart continued to pulsate about 60 beats  
 per second all this time. Immersion  
 in hot and cold water, blowing in with  
 mouth, and other means of artificial  
 respiration were employed.

Mother had no tears.

March 1915.

Normal labor; foetus very large, 10 $\frac{1}{4}$  lb.  
Membranes ruptured artificially. Due to  
lacerated & relaxed condition of vagina  
and perineum, caused by previous  
births, there was no tear.

March 1915 (1915) of 1915.

24  
1 conf.

Emergency (rush) confinement. Patient  
entered hospital at 6 A.M. and, seemed  
(judging from nurses report) to be in first  
stages of labor. Patient said she had been  
having pain about one hour. One hour  
later patient had one hard pain, so nurse  
rushed patient into confinement room,  
and she was prepared as rapidly as  
possible for labor. The next pain  
caused rupture of membranes, and  
membranes showed at vulva; next  
pain advanced foetus's head so that  
it was visible. The pain were  
then slightly held in check with  
chloroform. Child, large size,  
expelled after few more pains; vertex  
presentation. No tear.

Duration of first & second stages of labor  
not more than 3 hrs.

Duration of third stage, one hour.

March 1915 (1915) of 1915.

April 1915.

Patient was suddenly taken sick, Apr 17, at 3 A.M. Pain was excruciating and paroxysmal. At 12 o'clock they placed patient in canoe and started from Wells to home to hospital; the wind was up stream; so they did not arrive here until 1.30 A.M. Apr. 20. Patient was comatose at times, and pulseless. Death resulted at 8 A.M. same day.

The autopsy revealed the fact that about 8 feet of the ileum was a very dark chocolate color (gangrenous) and all the small intestine extended with gas. The mesentery was, in some places in the gangrenous area,  $\frac{1}{2}$  in thick. Further examination revealed a knot in this part of the intestines, one loop of intestine having slipped through another, and this was so tight and so tangled that it could not be unravelled until this part of the intestine was stripped from mesentery and divided in several places. The gangrene was caused by the strangulation of the mesentery & intestine.

Lungs were free from t. b. c., altho left lung was very firmly bound to chest wall with dense adhesions.

Bladder wall was very thick on anterior superior surface until it felt like a small tumor.

Mrs. Pete Duncan (204) Of Craig, As Lambie.

1 conf. Premature labor (7 mo) vertex presentation. Rapid expulsion of foetus. Weight of foetus 3 lb. Foetus lived 12 hrs. No tear.

November 1915

1 maj Laparotomy for suspected tumor of pelvis  
 Medium line incision, below umbilicus, about  
 five inches long, disclosed large ~~and~~ bilocular  
 cyst of left tube. There were only a few  
 cob-web adhesions between cyst and other parts,  
 so it was easily delivered through incision.  
 It was removed ~~by~~ without rupture, with  
 left tube and ovary; the tube was removed  
 by a V shaped cut in corner of uterus; the  
 peritoneum was then sewed so as to cover  
 the stump.

The gall bladder was then examined  
 through wound, and a concretion was felt  
 there about twice the size of a pea. As this  
 could not be removed without making another  
 incision, and as it apparently, had caused  
 no trouble no attempts were made to remove  
 it.

The abdominal wound was then closed with  
 continuous sutures, and skin closed with  
 a buried sub-cutaneous silk-worm gut.

Duration of anaesthetic  $1\frac{1}{2}$  hrs.

" " operation 66 minutes

Condition during operation good.

Mrs. Frank White (312) of Craig, As Dale, An. W. 1915

Excision of urethral caruncle.

1 minor Mrs. Frank White (312) of Craig, Sp. 1915  
 Primary union to both wounds. Patient was  
 walking around ward on 10th day

16  
 1 maj Laparotomy for prolapse of uterus and  
 sterilization of patient.

Medium line incision, below umbilicus,  
 exposed uterus and its appendages. The  
 round ligaments were shortened by  
 method (folding over and suturing to posterior  
 aspect of uterus) to hold the uterus in place.  
 The fallopian tubes were both ligated and  
 severed to render patient sterile.

For record of last child-birth see p. 56.  
 The abdominal wound was closed by

the usual method; interrupted a subcutaneous  
silk-worm gut suture closed skin incision

Birth of normal <sup>full term</sup> child. Patient entered hospital during advanced stages of labor and gave birth to child before physician could arrive. Illegitimate child. Grandmother and aunt expressed wish to kill child and so avoid disgrace. The laborer's mother lived with her parents and sisters in same house, and yet they never noticed that she was pregnant. The laborer's mother was in my office this morning yet it was never noticed by me.

There was a tear of perineum which was repaired with one silk-worm gut suture.

*Minnie Hayes ( ) Op. Craig.*

26.  
2 maj.

Excision of Superior Right Maxilla for Sarcoma.

As the sarcoma was advanced it was decided to do a radical operation. First the external carotid artery was ligated in the neck, between the lingual and superior thyroid branches, to control bleeding. The upper lip was then divided in midium line, from the margin to the nose; the incision, drawn to the bone, was carried around the nose, to the right, and up to the inner angle of the lower eye lid.

From here the incision was extended outward, to the external angle of the eye, exposing the zygoma and the frontal process of the malar bone. This flap was then dissected free from the bones, and thus exposing the tumor underneath. Over its most prominent part the tumor was soft; upon palpation the "egg-shell crackle" was elicited, proving that, as diagnosed, this was a sarcoma of bone. After the soft parts were dissected free from the bones, the zygoma was divided with the bone-cutting forceps at about its middle; the frontal process was divided in the same way, and also the nasal process. Now the pharynx was packed with gauze and the mucous membrane of cheek and lip was divided from its attachments at the alveolar process along its entire course on that side; the soft palate was divided from a point in front between the incisor teeth backward as far as the bony palate extended. With the chisel the bony palate was now divided in this line and separated. This left the superior maxilla freed from all bony attachments except those that were on its posterior surface, and which consist only of thin plates of bone. With a pair of bone grasping forceps this separated maxilla was twisted out. Portions of the tumor that were seen to be remaining were dissected out, including the lower plate of the orbital cavity. The under surface of the tumor was soft and fleshy, and of a grayish color. To check bleeding the wound was packed with hot moist gauze; the bleeding was not profuse, - only oozing.

The flaps of soft tissues was then brought back into place and

sutured with horse hair sutures, and occasional suture of silk worm gut.

At this stage the patient was in a very dangerous condition; - at times artificial respiration was started, and his pulse was very fast and weak. Atropine gr  $\frac{1}{50}$  was given hypodermically, and saline, with few drops of adrenalin, given intravenously. Under this treatment the patient rallied rapidly.

The next morning he was propped up in bed, to aid drainage. The only pain he said he had at this time was in his stomach - hunger pain.

The operation was performed at the Post Hospital. On the eighth day he was brought back to this hospital.

## Extraction of Senile Cataract.

Cocaine anaesthesia. Incision with Graefe knife. A preliminary iridectomy was made and then the capsule of the lens was ruptured with the cystome; the lens was expelled; and debris was irrigated out with normal saline. The iris did not tend to present itself in the wound, and there was no escape of vitreous.

Joel Katschkan (322) Op. Craig, As Dale.

After operation patient had no pain. Examination shows there was no prolapse of iris, and no escape of vitreous. In every way the result was perfect. Good vision without glasses.

11th  
1 conf.

Labor at full term; breech presentation.

The head came without any trouble, and child breathed without any assistance.

At birth child seemed normal in every respect. Tears of 1st degree only; no repair.

Baty Hallard (331) Op. Craig.

On 3rd day it was noticed that baby expectorated, or rather, that bloody mucus ran from mouth and nose. This continued for several hours. On the night of third day the night nurse found the pad & band of the baby saturated. She called the house physician who found the hemorrhage coming from the line of union of the umbilicus with the skin. To check it it was necessary to put a ligature around it and including the skin of abdomen. Considerable blood had been lost, and the child died about 2½ hours later. This, possibly, was a case of haemophilia.

Gastro-enterostomy for ulcer of stomach.  
 (May) Incision made from half inch below ensiform cartilage to half inch above umbilicus. This disclosed the stomach, and on the anterior surface, near pylorus but not in it, was seen the scar tissue of an ulcer. This white scar tissue was about size of a five cent piece. For the ulcer to be visible through the serous membrane it must have eroded very deeply.

A gastro-enterostomy clamp was placed on the first part of jejunum; an incision was made in meso-colon, and posterior wall of stomach brought through this, and a clamp placed on it near the pylorus and at the inferior boarder. This portion of stomach and ~~border~~ jejunum was delivered through wound, and the usual steps taken to perform the gastro-enterostomy. A portion of the redundant mucus membrane was excised from both the stomach and intestine. The incision in the guts was about  $2\frac{1}{2}$  inches in length. After the gastrojejunostomy was performed examination showed that there was no bleeding or oozing.

Examination of gall bladder was negative as to stones; there was no visible or other signs of tumors & cancer. There were very few adhesions.

Jack Rott (335) of Craig. As Doc, An. Surg. Watfield.

Ether anaesthesia, 22 oz used.

Duration of anaesthetic 1 hr 45 min.

" " operation 1 hr 25 min.

Condition during operation excellent.

Operation followed by almost no shock.

" " " " no pain.

On fifth day, contrary to orders, when patient's bowels moved for first time, he got up alone and walked to bath room.

On sixth day he was allowed up and around room. At end of week there was a very marked decrease in tenderness of

over the site of ulcer.

Patient at end of first week was able to eat more, and without distress, than he had for some time previous to operation.

Nov. 1916

Patient much improved; has gained forty pounds in weight.

Laparotomy, - Ovarian Cyst.

Mid line incision was made below umbilicus. Ovary and tube on right side were matted together. On left side the tube was in some better condition. The ovary contained a cyst the size of a small hens egg, which was removed.

Due to the previous operation for appendicitis there were many adhesions on that side. Some of these were broken up.

1 may Laparotomy for mass in abdomen near umbilicus. Diagnosed as a mass of tubercular omentum.

As patient was quite weak it was done under local anaesthetic. The solution ( $\frac{1}{2}$  of 1%) novocain, was injected in each layer of abdomen before incising that layer. The abdomen was opened and explored without any pain to patient. The mass was due to folds of omentum. Everywhere, on intestines and omentum, were fine tubercles about size of granulated sugar; also there were many cot-webb adhesions. The uterus and tubes seemed to be in more advanced stage, so it was decided to remove both tubes, which was done, leaving one ovary.

When traction was made on uterus to deliver it near the wound, for the purpose of removing the tubes, due to the many adhesions, some pain was caused, so a few whiffs of chloroform were administered, enough to produce only the first stage of anaesthesia. As soon as tubes were removed the chloroform was discontinued. The operation left no doubt that she was suffering from tubercular peritonitis.

*Mrs. Ally Johanson (341) Op. Craig, As Dale. As Surg. - 1916*  
Patient had little vomiting and very little shock. She soon began to gain in weight and when she left hospital was much improved in every way. Primary union of wound.

1 may Repair of lacerated perinium.  
Mucus membrane elevated and muscles found and stitched together. All this done entirely under local anaesthetic. Novocain ( $\frac{1}{2}$  of 1%) without pain to patient.  
*Mrs. Aldman Kasko (348) Op. Craig, As Dale*

# Operation for Exophthalmic Goiter.

1. may

The right half of gland was enlarged to size of small egg. The exophthalmic symptoms were far advanced. As these cases take anaesthetics badly it was decided to do the work under local anaesthesia.

About 15 c.c. of novocaine solution  $\frac{1}{2}$  of 1%, was injected ~~at~~ into the posterior border of sterno-cleido-mastoid muscle; this gave anaesthesia to mid line of neck. The ~~stern~~ incision, over the upper pole of the gland, was made in the natural crease of the skin; this exposed the ~~arteries~~ + ~~veins~~ veins supplying gland. A ligature of Chromic catgut, doubled, was passed around vessels close to gland, and securely tied. Wound then closed by usual method, without drainage. Wound healed by primary union. The

After Harry Rich (349) Op. Craig, As. K. & Co.

25th.

Removal of many large internal-external hemorrhoids under local anaesthetic; Quinin + urea hydrochlorate + novocaine. These hemorrhoids, instead of being soft + turgid were hard and seemed to contain large amount of fibrous tissue. After sphincter was dilated a stricture of small caliber was found, a fingers length

from the anus, that would not permit the little finger to pass. The rectum seemed contain ridges of hard fibrous tissue below stricture. During the manipulations various amounts of thin yellow pus escaped from time to time; the origin of the pus being from above the stricture. A small piece of tissue was removed from rectal wall near stricture for microscopical examination to determine if it was malignant.

The microscopical examination revealed the presence of a large amount of fibrous tissue in the hemorrhoids and in specimen from stricture but there was no indication of malignancy.

Miss Mary Helburn & Sp. Craig, Asst. Surg. Genl. H. A. H. H. H.

## Caesarian Section for Eclampsia

The patient a white woman, entered hospital Oct 31, feeling well but ~~had~~ albuminuria. That night she was extremely nervous; the next morning she complained of poor vision. Two hours later she was totally blind. By this time she was very very nervous, and once threw herself out of bed. In a few moments convulsions of eclampsia set in. These followed each other rapidly, sometimes occurring as often as once every fifteen minutes. When not having convulsions she was in a deep coma from which she could not be awakened. Her temperature was 103°. It was thought that she would live only a few hours, unless the convulsions could be stopped. She was taken to operating room and prepared for Caesarian Section. A live child was removed in eleven minutes. No difficulty was encountered either from hemorrhage or in removing the placenta. Cervix was dilated thru the uterine incision. Uterus & Abdominal wall was then closed without drainage.

The patient had no convulsions until four hours after operation; they then recurred at frequent intervals for three hours, but were controlled with massive doses of chloral hydrate.

Patient left the hospital, cured, on 17th day with a healthy child. Weight of baby at birth was 8 pounds.

When mother left hospital vision was bad in one eye, but fairly good in other.

Mrs J. C. Jansson (476) Of Craig, As Garside & Carlson  
An. Sgt. Watfield.

# Prostrial Gastro-Enterostomy

Patient had all symptoms of chronic pyloric ulcer.

Through a five inch incision the pylorus was exposed; and prostrial gastro-enterostomy performed. A marked ulcer was found visible.

Patient recovered from anaesthetic, and seemed to be doing nicely until the middle of the afternoon, when he began to vomit small but frequent amounts of coffee ground material (blood).

Adrenaline sol. in v was given every half hour by mouth. The patient continued to spit up very small quantities of this blood for several days. There was not <sup>sufficient</sup> ~~loss~~ ~~loss~~ of blood to cause much shock. Wound healed by primary intention with the exception of a very small stitch abscess. Patient was up and around ward by 13th day. During his stay here he, at times, eructated one or two ounces of bluish-green fluid.

29 Normal labor, breech presentation.

2.

Operation for chronic appendicitis.

The operation was performed entirely under novocaine anaesthetic, 1/4% strength solution being used. Incision about four inches long was made through right rectus sheath. The appendix was located in about three minutes after incision into abdomen was completed, and was brought out of the wound without pain. The meso-appendix was slightly injected with novocaine and ligated & cut. A purse string suture of linen thread was inserted around base; appendix was ligated with catgut, removed, and stump buried under purse string suture. The base of appendix was not injected with novocaine, and this caused a slight nausea of which the patient complained, but this passed away soon. The patient expressed a desire to see the field of operation before appendix was severed, so his head was raised and he was shown the cecum, which was delivered into wound, and the appendix. He repeatedly made the statement during the operation that it was not as painful as a visit to the dentist. Wound closed with subcutaneous of silk worm gut by usual method. Patient ate dinner of toast & eggs, coffee, etc one half hour after being removed from surgery. He never complained of pain, altho he did have a little nausea during the afternoon. On fifth day he was allowed to sit in chair; on sixth day he walked around room & halls; on twelfth day he went down to his office to work. Silk worm gut removed on 8th day; perfect union.

Lieut L. D. Davis (633) Op. Craig, As Gariside.

Stick of silkworm gut, <sup>was</sup> removed on 9th day. Wound healed perfectly. On 12th day patient was about his duties at the post.

Mar  
6  
1 min.

Excision of internal & external haemorrhoids. *Noro-caine* (1/4%) used as anesthetic. After stretching of sphincter the hemorrhoids were clamped at base with a long narrow forceps, redundant part excised, and catgut suture looped around forceps through the tissues. When forceps was withdrawn the catgut was drawn tight & wound closed. Altho there was no pain during operation patient complained of severe pain and heaviness in rectum for next two days. Patient was up on fifth day.

Remarks: We note that there has been less post-operative pain in those cases in which we have used quinine and urea than in this case in which *noro-caine* was used.

Rev. E. L. Winterberger (635) Op. Craig, As. Garside, *Noro-caine*.

7th. Enucleation of tonsils and removal of adenoids.

1 min.

Louise Jackson (638) Op. <sup>Dr. W. G.</sup> Craig Gable, As Craig & Garside  
Anaes Carlson (Editor)

By courtesy this operation was given to Dr W. G. Gable, of Skagway, who was visiting the hospital for the day.

Patient left hospital on second day after operation.

## Caesarian Section.

11th.  
1 maj

Patient had slight labor pains for six days. On sixth day there were <sup>spasmodic</sup> twitchings of muscles of mouth & face, which at times continued for many minutes. During the evening the patient seemed to get rapidly worse and was unconscious for some moment.

As a diagnosis of toxemia of pregnancy was made, with possibly eclamptic seizures, it was decided to do a <sup>imperfect</sup> Caesarian section immediately, even though it was ten o'clock P.M.

Patient was given anesthetic in operating room, and field of operation prepared by

painting with tr. iodine. Incision made from pubes to three inches above umbilicus. No attempt was made to compress uterine arteries in broad ligament as experience had taught us that this was unnecessary. One towel was placed on each side of uterus, to keep blood & fluid out of abdomen. Uterus was not delined through wound, or no attempt made to do so. A longitudinal incision about seven inches in length was made in uterus, and a hand inserted legs of child (which was in P. O. A. position) grasped and removed. The placenta was compressed and removed immediately. The whole uterus was then massaged with hands for a moment or two, and a hot towel inserted into incision; this caused immediate contraction of that organ. Three layers of sutures were inserted to close uterine incision. Abdominal wall closed without drainage in usual manner.

Duration of anaes. 1 hr 30 min.  
 " " operation 1 hr. 15 min.

The child was delivered alive in 7 min from time of first cut of knife.

Patient seemed to have comparatively little shock from operation; she combed her hair on third day.

Mrs. Ed. Warren (627) Op. Craig, Co. Garside & Clark,  
 Anaes. Sp. Watfield, Eber 3x.

Patient made rapid recovery. Wound healed by primary union. Silk-worm gut suture removed on 13th day.

1 min. Excision of calcaneal spur of left foot. Incision  $2\frac{1}{2}$  inches long made along the inner border of heel, tissues retracted, periosteum elevated and spurs removed with chisel and hammer. Wound was closed without drainage. Morocaine ( $1\frac{1}{2}\%$ ) anaesthetic and was absolutely painless.

Bessie Edwards (623) Op. Craig, Co. Garside.

16.

## Prolapse of Uterus.

Curettagé of uterus was performed for endometritis. Examination, manual, at this time while patient was under anaesthetic gave same results as had been ascertained before; viz: that that there was marked retroversion of uterus, the fundus being posterior and even lower than cervix.

Incision<sup>was</sup> made in median line about five inches in length. Tubes and ovaries were examined, and were apparently normal. The round ligaments were then brought through rent in broad ligament and were folded to back of uterus and there sutured to the posterior uterine wall. This brought the uterus in its normal position.

An examination was also made of appendix, and gall bladder was palpated, both organs seemed normal.

The original abdominal incision was then lengthened to above the umbilicus. As there was a small umbilical hernia the umbilicus was excised and flaps of fascia brought together. The wound was closed in usual manner without drainage.

Duration of curettagé 9 min.

" " laparotomy 64 "

Operation commenced 9:15 A.M. Concluded 10:52 A.M.

Ether 3x.

Condition during operation good.

Little post operative pain and nausea.

Mrs. Alfred E. Gordon (631) Op. Craig, As. Garide, An. Carlson

20th  
min. Excision of gland under chin size  
of small hickory nut. Novocaine, 1/2%, used as  
anaesthetic. Wound closed without drainage.  
Johnie Perrin. (642) Op. Craig. Local anaesthetic.

30th.  
1 maj Laparotomy for Pelvic Pain.  
Incision <sup>made</sup> in medium line below  
umbilicus. Uterus was found to be markedly  
retroverted and pressing against rectum. Right  
tube and ovary were inflamed + adherent;  
these were both removed: a V shaped piece being  
removed from cornu of uterus at junction of tube.  
The Murphy operation of shortening the  
round ligaments for retro-version was then  
performed. Wound closed without drainage.  
Mrs. Tom Jimmy (615) Op. Craig. As Garbide + Suckow. Dr. Carlson  
Ether 3 <sup>XIII</sup> administered  
Duration operation One hour + twenty four minutes.

Closure of Gastro-Jejunostomy Opening.  
Patient was operated upon Nov 5, 16 (see page 88) and a posterior gastro-enterostomy performed.

Each morning, following recovery from operation, the patient, immediately after taking breakfast, would eructate from one to three ounces of gastric juice, which was a clear pale straw color. Altho this always occurred after breakfast, yet no food was eructed with this very sour liquid. These eructations caused him so much distress that he demanded operation, after medical treatment proved of no avail.

X Ray was taken following breakfast meal, and this showed that the stomach emptied itself very quickly, and that both the pylorus and artificial opening were patent. It was deemed necessary to close artificial opening.

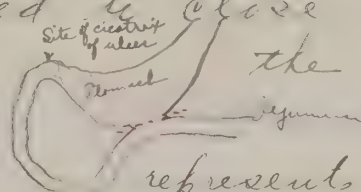

Incision was made five inches long by side of scar of previous operation, which was excised. There were many adhesions of omentum to the abdominal scar.

Stomach was partly brought out of wound disclosing both pylorus and the site of the artificial opening.

There was a cicatrix on the pylorus

Apparently the site of the ulcer, which was not found at previous operation. The gall bladder seemed to be same size of wall out, and walls seemed dense, however no stones were palpable. At previous operation gall bladder was normal.

The seat of the artificial opening was delivered into wound and a linen suture used to close off opening by sewing across the tissues at this point.

The red dotted line represents the insertion of the linen sutures to close off opening.

Wound was then closed in usual manner without drainage.

Anaest commenced 9. 02

24.  
1 conf. Normal labor, primiparae; tear of first degree of which the edges were in such good apposition that no stitches were taken.

Mrs. Oscar Phipps (678) Op. Craig.

25.  
1 min. This patient was brought into hospital in an exsanguinated condition and state of shock. Twelve hours previously his <sup>right</sup> hand was caught in the cogs of machinery. He was first placed in bed and hot coffee and heat applied and given a few hours rest with morphine; then an anaesthetic was administered. It was found that the index, second, and third fingers were completely chewed up in short pieces by the cogs. The little finger was split on palmar surface from first to second joints. The meta-carpal bones were splintered and torn loose from tissues of palm. The loose pieces of bone were pulled out with fingers, and with a pair of scissors the loose and badly bruised tabs of skin were removed. Only one vessel was ligated. No attempt whatever was made to repair the wound but rubber tubes?

were inserted into depths of wounds and Dakins solution was injected through these (10 cc in each tube) every two hours.

At the end of 36 hrs there was  $1\frac{1}{2}$  degrees of temperature, the dressing was then changed and the temperature dropped. After that dressings were changed daily and there was no more fever. The Dakins solution at first caused a little smarting, and so the strength was reduced from 1 to  $\frac{1}{2}$ %. It was our plan to do no amputating until it was determined how much should be removed, but the hand improved so much and so fast that it was much better than we even hoped for.

Elmer Snow (680) Op. Craig. An. Garside Carlson

Normal Labor; foetus was ~~very~~ large & well developed, weighing ten lbs., but never breathed. As soon as head was delivered (vertex presentation) a finger was inserted to ascertain whether cord was around neck of foetus; it was found to be encircling the neck twice. An attempt was made to slip the coil over head of foetus but, due to its shortness, it could not be done. As there was considerable tension on the cord, it was severed with scissors between forceps. When child was born the pulsation of arteries could be seen at umbilicus and heart sound were very clear but it was impossible to get the child to breathe by either ordinary or extraordinary methods; slapping, artificial respiration, hot & cold water, blowing in mouth through a protecting piece of gauze, and insertion of rubber tube into pharynx were of no avail. The heart continued to pulsate for more than one hour but the child never breathed.

Mrs Thomas Esping (Mrs. Paddy Anabuty) Op. Craig.  
Assist. M. C. Callahan, & Seckman

Normal labor, vertex presentation.

Mrs. W. E. Polly. Op. Leary. (Confined in patient's home)

## Caesarian Section

24 This patient was in very advanced state of tuberculosis, and it was thought that she could not give birth to her child. When the father was told this he asked if there was any way of saving the child. He was told that, if the mother could not deliver the child, or if she died in childbirth, the only chance of saving the baby was to do an immediate Caesarian section, even before as soon as mother had died. As the mother was so very weak to give her an anaesthetic,

or even under local anæsthetic to do a caesarian section would have <sup>absolutely</sup> meant ~~absolutely~~ meant her death, it was decided to not perform the operation.

To hasten the process, when the mother began to weaken, pituitrin was administered but without setting up any pains. Finally patient began to pass some blood from vagina & weakened. The father <sup>of child</sup> expressed the wish that if the mother died the child be removed at once.

It was about 15 minutes after death before I could get there & begin the operation. As mother was dead no aseptic precautions were followed but all haste made to remove foetus. In about two minutes foetus was removed and all measures used for resuscitation but the child dead.

*Mrs. James Willard. (Performed in home)*

18 Circumcision for phymosis.

1 min *Ross Trusdale (St Seward) Out patient Morocaine.*

18 Excision of small hard tumor, size of pea, from palmar surface of hand.

Mrs. Dora Sklenoot (698) Confined by Hilja Carlson.

28th

Amputation of left hand at junction of carpus + metacarpus.

The hand was shattered by explosion of three sticks of dynamite which he held in his hand. Only stumps of two of fingers left and with very skin on them. The flaps were trimmed up a little and Dakins solution used. Second amputation necessary when it has been determined the amount of tissue dead.

There was also a rupture of left eye ball at inner margin, caused by the force of explosion, with some loss of contents and prolapse of iris into wound which could not be replaced.

Over biceps muscle of right arm there was found to be a small wound - size of a dime - and from this hole a piece of skin and tissue of left hand was removed, having been forced in by the explosive force.

Second and third fingers on right hand badly traumatized.

Neck + face were covered with small superficial wounds.

Dakins solution was used on -

all the wounds. Argylol 10% instilled  
in eyes. Recovery from shock & loss of  
blood was rapid.

September  
 Normal labor; vertex presentation.  
 Mrs. B. A. Barnett ( ) Op. Craig, As.

Murphy Operation for Retro-version  
 Curettage of uterus for endometritis  
 and discharge.

Median line abdominal incision made  
 above pubes. Uterus was found to be  
 markedly retro-verted - in fact it was  
 resting against rectum. The two round  
 ligaments were folded on posterior  
 surface of uterus and sutured there,  
 thus shorting them each about  $1\frac{1}{2}$  inches.  
 This brought uterus in normal position.

The appendix was sought and  
 found. As it was exceedingly long, five  
 inches, it was removed in usual manner.

A few small pedunculated cysts,  
 not larger than a cherry stone, were removed  
 from right tube. This tube also seemed  
 to have a roughened appearance, altho there  
 were no signs of inflammation or adhesions.

Abdominal wound closed in usual  
 manner without drainage.

Mrs. M. J. Hanson ( ) Op. Craig, As. Col. McAndrews &  
 Miss. Garside, An. Carlson.

Wound healed by primary intention;  
 patient left hospital on 15th day.

Patient's strength returned to normal  
 rapidly. At Examination made about six  
 weeks after operation, the uterus was found  
 to be in normal position. The patient  
 said the symptoms, such as severe back-ach  
 were much improved.

Normal rapid labor  
 Mrs. Pearl Allen (725) Op. Craig.

## Gastro-Pylorostomy.

The patient had chronic ulcer of stomach pylorus and for two weeks was unable to ~~pass~~ pass any food on stomach, as, after 36 hours it was vomited.

Medium line incision five inches long<sup>was</sup> made. There were no adhesions encountered; the pylorus was easily exposed and site of ulcer as shown by scar tissue, demonstrated. As was expected the ulcer was pyloric. The stenosis of the pylorus was not entirely due to the scar tissue which had contracted, but to the swelling & induration around the ulcer, involving the whole pylorus.

An examination of the other organs, such as gall-bladder & pancreas, showed them to be normal.

A posterior gastro-pylorostomy was then performed. Two layers of catgut-chronic-suture were used.

Wound closed in usual manner.  
James Davidson (721) Op. Craig, Asst. Col. W. Andrews  
An. Carlson, Ether.

Patient was in hospital forty days and gained 30 pounds during that time. Dec. first he began light work and on Dec 14 he joined Forrestry service of U.S. Army; he then seemed to be in perfect health.

16th

Normal labor followed by post partum hemorrhage one hour later. Patient seemed well, altho very weak, and went home on 14th day. Discharge had not quite ceased at this time, soon after going home another post-partum hemorrhage occurred. Every few days clots were expelled, usually of small size. At last discharge began to have the characteristic odor of saprophytic infection. Patient was then taken back to hospital, six weeks after labor.

Examination on table showed presence of dark mass with in cervix, which bled freely when touched. With placenta forceps, this mass was grasped and removed. It proved to be a cone shaped piece of placenta, half size of tennis egg, and had a terrible odor. Cervix was then packed slightly with gauze to control bleeding.

Examination under anaesthesia <sup>diagnosis of</sup> tumor protruding from cervix. Cervix dilated. Diagnosis made of pedunculated fibroid of mucus membrane of uterus, and that the only treatment, due to location of tumor and its rather broad base of attachment, was to remove uterus. *Mrs. Henry Vermeire (775) of Craig, Co. Col. McCandless An. Female*

24.  
1 maj.

Removal of uterus. Incision made in median line above pubes. Uterus was found to be of about twice normal size, altho there were no irregularities of outline, despite the fact that we had made a positive diagnosis of fibroid of mucus membrane. Uterus was removed in usual manner, leaving tubes and ovaries in situ. The body of uterus was amputated just above cervix. The stump of cervix was covered with peritoneum in usual manner to which was sewed the severed ends of round ligaments and broad ligaments to act as supports for cervix. Abdominal wound closed without drainage in usual manner.

(The operation was necessary because of severe hemorrhages from uterus which had persisted since birth of last child six months before.)

Wound healed by primary union. Patient was up around ward on 10th day; on 12 day she insisted on going home; on 14 day she did her usual weekly washing for her family of 8 or 10.

*Mrs. Henry Vermeire (780) of Craig, Co. Col. McCandless An. Female*

# #62 Bunion Operation.

The Mayo technique was followed in this operation. About half of head of metatarsal was removed with bone cutting forceps. The entire operation was done under local ~~operation~~ anaesthetic with absolutely no pain to patient.

*Mrs. Henry Garside (779) Op. Craig. Novocaine 1/2%.*

Patient made good recovery and in 3 weeks seemed to be walking without trouble.

May  
2nd  
1918.

May 1918.

Inguinal Hernia Operation.

The hernia, right side, was partly scrotal. The usual Bassini operation was performed. The sac separated easily. Wound closed in usual manner without drainage. Local anaesthesia perfect.

James Gray (783) Op. Craig, As McAndrew, Novocaine.  
Wound healed by primary union and patient left hospital on 22nd day.

22  
1918

Removal of warty polypus, size of small hen's egg, from cervix. Cervix was found to be ulcerated superficially. The uterus was packed with gauze after being curetted.
